1. Principles of operation

There are two diaphragms fixed to the centre rod, one at each end. When compressed air is supplied to air chamber B (right side, see Fig. 1.1.), the centre rod moves to the right, the material in liquid chamber B is pushed out, and at the same time material is sucked into liquid chamber A.

When the centre rod is moved full-stroke to the right, the air switch valve is switched, compressed air is sent to air chamber A (left side, see Fig. 1.2.), and the centre rod moves to the left. The material in liquid chamber A is pushed out, and at the same time material is sucked into liquid chamber B.

Through repetition of this operation, material is repeatedly taken in and discharged out.
